

Mind Map of Evolution.

How does the Mind Map of Evolution help to better understand the integrity of information of corporate and political systems.

[> Open the research <](#)

Conclusion of the research

The goal of all needs is *to store and reorganize information*.

But not just any, but *information about which parts of "me" can be used in an automated fashion to turn the world around "me" from chaos to order, and from dead ends to the diversity*.

And the reason of this is usually *a response to events that affect "me", but don't take into consideration all of "my" capabilities and integrity, and thus are harmful to "me"*.

Everything that falls under this criterion (everything that stores information about which parts of it turn the world from chaos to order **and** from dead ends to diversity) can be considered a form of life, and it should be treated as an equal.

Hints on how to use the mind map

To expand the branches click on *the numbers*.

To collapse the branches click on *the minus signs*.

To expand all branches at once press **CTRL+9**.

Interpretations of the conclusion

Hints on how to improve life, based on this conclusion

- To speed up self-development or research, learn *parts **of yourself** that you use to turn the world from chaos into order and from dead ends to the diversity*.
- When you study a self-sustainable structure (a person, a project, a company, a country) - find out *which of **its** parts turn world chaos to order and from dead ends to the diversity* to see its limits.
- When you study a self-sustainable structure (a person, a project, a company, a country) - find out where and how this structure saves *information about which parts **of it** turn the world from chaos to order and from dead ends to the diversity*, to see whether it is really self-sustainable, or it depends on someone or something.
- When you try to manage a self-sustainable structure (a person, a project, a company, a country) - find out *which of **its** parts turn world chaos to order and from dead ends to the diversity* to support them (strengthen whatever makes them stronger, and remove whatever harms them).
- When you try to manage a self-sustainable structure (a person, a project, a company, a country) - find out where and how this structure saves *information about which parts **of it** turn the world from chaos to order and from dead ends to the diversity*, and what channels of access to this storage does it have, so that when it has a difficulty, you would know where exactly to put things in order.
- Allow an essence from which you want privileges, to store *information about which of **its** parts it uses to turn the world from chaos to order and from dead ends to the diversity*, and allow it to have the sole access to this information, to get "equal rights" with it.
- When creating a project (or managing a project) make it so that *information about which parts **of this project** turn the world from chaos to order and from dead ends to the diversity* gets stored in a way so that project as a whole would have full access to this information, but not one of its components could make a duplicate of this information - this way the project will be stable.

- The information about parts **of the structure** that the structure is using to turn the world from chaos to order and from dead ends to the diversity is confidential (only this essence - in this case, a company - has the right to live off of converting/relocating other essences using this information).
- Storing and looking for *information about which parts **of yourself** you use to turn the world from chaos to order and from dead ends to the diversity* is your responsibility and only yours.
- The best method of self-defense (protecting yourself from events that do not consider all of your capabilities and integrity, and thus are harmful to you, or events because of which you get forced to do something at a cost of your health or future) is to learn *which parts **of yourself** you use to turn the world around you from chaos to order and from dead ends to the diversity*.
- If your project gets affected by events that do not consider all of its capabilities and integrity, and thus are harmful to it, the best method of its defense is to automate the procedure of learning *which parts **of it** the project uses to turn the world from chaos to order and from dead ends to the diversity* (open the research and development department).
